

## EntraPASS Redundant Server

**Note:** The Redundant Server component will be available only if it has been previously registered.

You can define the Auto-restart delay (m:ss) for the Mirror Database and Redundant Server. The time range value is 1:00 to 9:59.

Quick synchronize: When this option is checked, the main server does not close the tables during the synchronization with the mirror database. Messages can still be received and the database viewed. A yellow button is then displayed on the left to indicate that the system is in read only mode.

**Note:** The MS/SQL Interface program is not supported by the Mirror Database and Redundant Server. Even though the MS/SQL Interface cannot connect to the Mirror Database and Redundant Server, the MS/SQL Interface will buffer all the events.
