

## PORTABLE TURNSTILE BASE PLATE

The Portable Turnstile Base Plate is a heavy-duty platform designed to support turnstiles in temporary or relocatable access control applications.

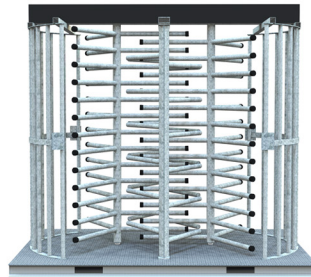

Portable base systems allow secure entry points to be deployed without permanent concrete foundations, making them ideal for construction sites, temporary facilities, remote installations, and evolving jobsite environments.

Base platforms can be repositioned by forklift and may also include optional crane lifting points and ramp accessories for improved transportation and site access.

TURNSTILES.us can provide complete portable turnstile systems pre-mounted to the base platform, or portable bases separately for field installation onto existing equipment.
